## Operating instructions

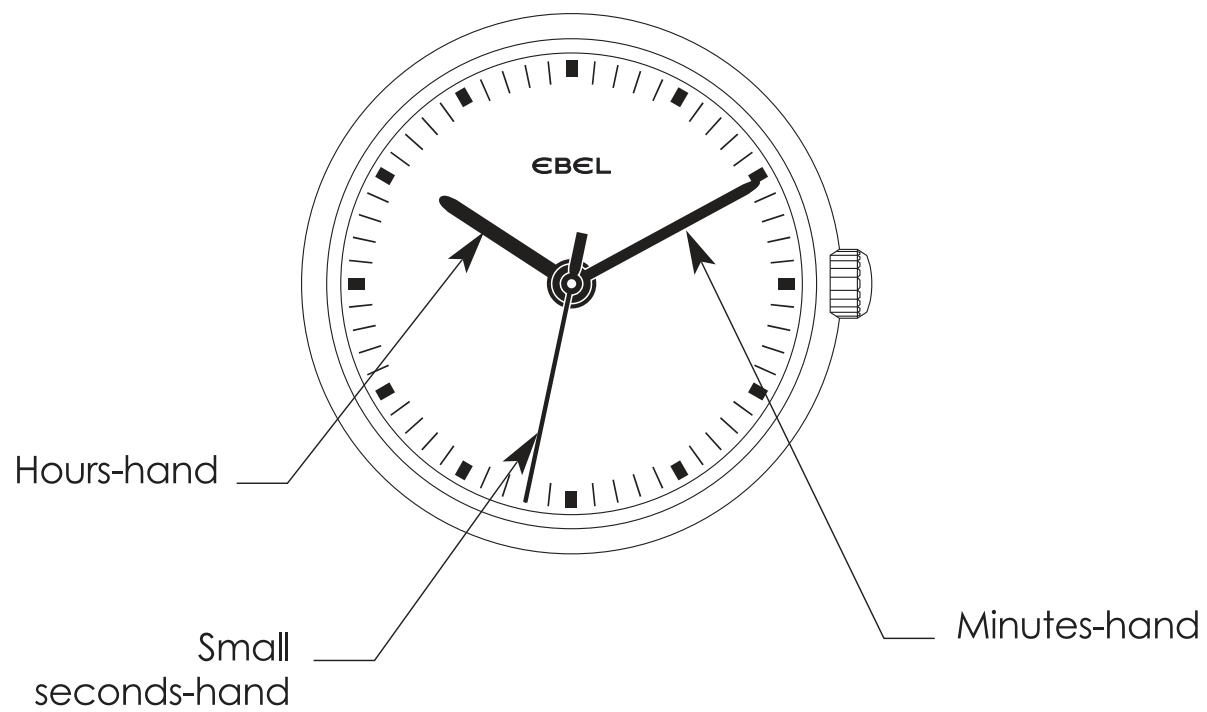

### **Power reserve**

An important feature of every automatic winding watch is its power reserve. Before putting your watch on, you should wind it up manually (20 turns of the crown) in order to create an initial power reserve for its operation.

To retain its power reserve, the watch must be worn continuously and actively for at least 8 hours per day. Should you be unable to wear your watch for the minimum amount of time each day or should it be left idle for 24 hours at a stretch, repeat the steps outlined above.

Our technical centers will be glad to answer any questions you may have in this regard.

## Watch functions

### Manual winding

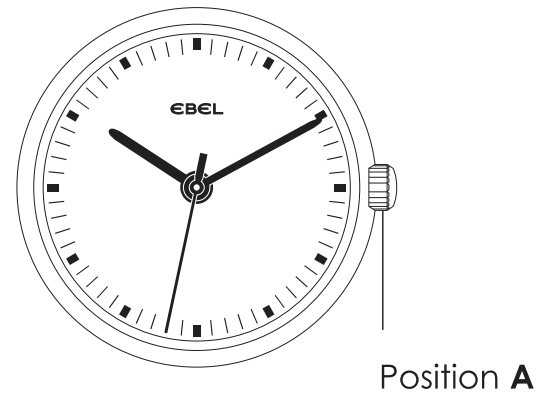

*If your watch comes with a screwed-in crown, unscrew it before doing anything else.*

Crown in position **A**.

If the watch has not been worn for several days, wind it up manually with 20 careful clockwise turns of the crown.

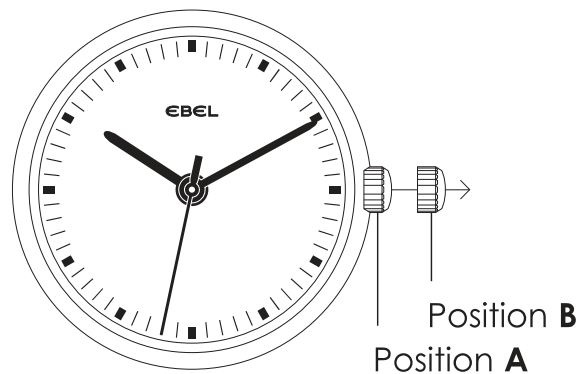

Once you have done so, the watch will wind itself up automatically with your wrist movements.

*Do not forget to screw back the crown.*

### Setting the time

*If your watch comes with a screwed-in crown, unscrew it before doing anything else.*

### Watch without calendar

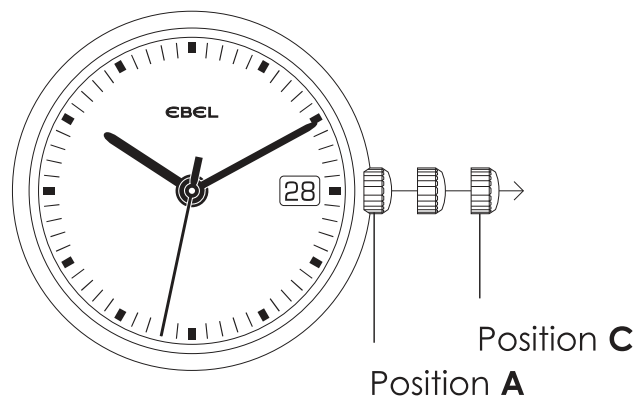

Pull the crown out to position **B**.

Turn the hands clockwise until the right time is reached then, in synchronization with a time signal or against a reference clock, push the crown back to position **A**.

### Watch with calendar

Pull the crown out to position **C**.

Turn the hands clockwise until the date changes (midnight). Continue to turn the hands until the right time is reached then, in synchronization with a time signal or against a reference clock, push the crown back to position **A**.

*Do not forget to screw back the crown.*

## Operating instructions

---

### Setting the date

*If your watch comes with a screwed-in crown, unscrew it before doing anything else.*

Pull the crown out to position **B** then turn it until the right date is reached. Push the crown back to position **A**.

*Do not forget to screw back the crown.*
